

Application No.: 10/633,107

Docket No.: P-5315C1

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings of claims in the applications:

Listing of Claims

1. (Currently Amended) A locking element for a single use syringe having an inside surface, comprising:
 - a ~~base including a~~ generally trough-shaped ~~body-base~~ having first side wall, a second side wall opposing said first side wall, a bottom wall and a longitudinal axis;
 - a first leg extending proximally from said base-first side wall substantially parallel to said longitudinal axis;
 - a second leg extending proximally from said base-second side wall substantially parallel to said longitudinal axis, said second leg being in opposing relation to said first leg;
 - a first barb extending from said first leg towards the inside surface;
 - a second barb extending from said second leg towards the inside surface;
 - said first leg including a first end portion extending generally towards said longitudinal axis;
 - said second leg including a second end portion extending generally towards said longitudinal axis, and
 - a spring element extending proximally from said bottom wall, said spring element for urging said barbs in a selected direction towards the inside surface of the syringe, said spring element attached to said base.
2. (Original) A locking element as described in claim 1 wherein said base, legs and spring element are of integral construction and formed from a substantially flat, integral sheet of metal.
3. (Original) A locking element as described in claim 1 wherein each of said first and second legs include an inner edge and an outer edge, said first and second barbs extending, respectively, from said outer edges of said first and second legs.
4. (Cancelled)
5. (Currently Amended) A locking element as described in claim 4-1 wherein said third leg spring element is pivotally attached to said basebottom wall.

Application No.: 10/633,107

Docket No.: P-5315C1

6. (Currently Amended) A locking element as described in claim 5 wherein said third leg-spring element has a bend therein.

7. (Currently Amended) A single use syringe assembly comprising:

a barrel having an inside surface defining a chamber for retaining fluid, and open proximal end and a distal end having a passageway in communication with said chamber;

a plunger rod assembly including an elongate body portion having a proximal end, a distal end, and a stopper mounted to said elongate body portion proximate said distal end, said stopper being slidably positioned in substantially fluid tight engagement with said inside surface of said barrel, said elongate body portion extending outwardly from said open proximal end of said barrel; and

~~a generally trough-shaped locking element positioned within said barrel, said locking element and~~ defining a channel, said elongate body portion of said plunger rod assembly extending through said channel, said locking element having

a generally trough-shaped base including at least one side wall and a bottom wall;

at least one leg extending proximally from said at least one side wall;

at least one barb extending from said at least one leg towards said inside surface;

said at least one leg including an end portion extending generally towards said plunger rod; and

a spring element extending proximally from said bottom wall, said spring element urging said at least one barb towards said inside surface of the syringe;

~~wherein one or more barbs extending from said locking element, said one or more~~ said at least one barbs engaging-engages said inside surface of said barrel for substantially preventing said locking element from moving proximally with respect to said barrel but allowing movement of said locking element towards said distal end; and

said locking element engages said elongate body portion of said plunger rod assembly such that said locking element is movable towards said distal end of said barrel as said plunger rod assembly is advanced; and

~~a spring member attached to said locking element and urging said one or more barbs~~ towards said inside surface of said barrel.

Application No.: 10/633,107

Docket No.: P-5315C1

8. (Currently Amended) A single use syringe assembly as described in claim 7 wherein ~~said locking element~~ at least one leg includes ~~first and second~~ an edges, ~~said one or more~~ at least one barbs extending from said at least one edges, ~~and said spring member being integral with said locking element.~~

9. (Currently Amended) A single use syringe assembly as described in claim 8 wherein said elongate body portion of said plunger rod assembly includes first and second adjoining portions, said first portion being distal of said second portion and having a smaller diameter than said second portion, a first shoulder separating said first and second portions, and a stop surface at the distal end of said first portion, said ~~at least one leg~~ locking element having a distal end engageable with said stop surface and a said base having a proximal end engageable with said first shoulder.

10. (Currently Amended) A single use syringe assembly as described in claim 9 wherein said at least one wall includes a first wall and a second wall opposing said first wall with said bottom wall disposed therebetween and at least one leg including ~~locking element includes a base and a first leg extending proximally from said first wall and a second legs extending proximally from said base~~ second wall, said first and second legs being in substantially opposing relation and having end portions engageable with said elongate body portion of said plunger rod, ~~said spring member comprising a third leg extending from said base between said first and second legs.~~

11. (Currently Amended) A single use syringe assembly as described in claim 10 wherein said first and second legs include inner edges adjoining said ~~third leg~~ spring element and outer edges, said outer edges of said first and second legs including ~~one or more~~ said at least one barbs.

12. (Currently Amended) A single use syringe assembly comprising:
a barrel having an inside surface defining a chamber for retaining fluid;
a plunger rod assembly including an elongate body portion having a proximal end, a distal end and a stopper mounted to said elongate body portion, said stopper being slidably positioned in substantially fluid tight engagement with said inside surface of said barrel, said elongate body portion extending outwardly from said barrel;
a locking element positioned within said barrel, said locking element including a base including first and second opposing walls and a third wall connecting said first and second

Application No.: 10/633,107

Docket No.: P-5315C1

walls, a first leg extending proximally from said first wall, a second leg extending proximally from said second wall, said first and second legs being in opposing relation, a first barb extending from said first leg and engaging said inside surface of said barrel, a second barb extending from said second leg and engaging said inside surface of said barrel, said first leg including a first end portion engageable with said elongate body portion of said plunger rod assembly, said second leg including a second end portion engageable with said elongate body portion of said plunger rod assembly, said first and second barbs being positioned to substantially prevent said locking element from moving proximally in said barrel, but allowing said locking element to move distally within said barrel; and

a third leg pivotally extending proximally from said third wall of said base and towards said inside surface of said barrel, said third leg resiliently urging said first and said second barbs towards said inside surface of said barrel, each of said first and second legs including a substantially flat body having an inner edge substantially adjacent to said third leg and an outer edge, said first and second barbs extending, respectively, from said outer edges of said first and second legs.

~~means for resiliently urging said first and said second barbs towards said inside surface of said barrel.~~

13. (Canceled)

14. (Canceled)

15. (Cancelled)

16. (Currently Amended) A single use syringe as described in claim ~~15~~ 12 wherein said elongate body portion of said plunger rod assembly includes first and second adjoining portions, said first portion being distal of said second portion and having a smaller diameter than said second portion, a first shoulder separating said first and second portions, and a stop surface at the distal end of said first portion, said first and second inwardly extending end portion of said first and second legs being engageable with said first shoulder, said locking element being engageable with said stop surface.

17. (Original) A single use syringe as described in claim 16 wherein said elongate body portion of said plunger rod assembly includes a second shoulder proximal of said first shoulder, said end portions of said first and second legs being engageable with said second shoulder.

Application No.: 10/633,107

Docket No.: P-5315C1

18. (Original) A single use syringe as described in claim 17 wherein the distance between said first shoulder and said stop surface is substantially the same as the length of said locking element.

19. (Original) A single use syringe as described in claim 18 wherein said locking element is formed from a substantially flat, integral sheet of metal.

20. (Original) A single use syringe as described in claim 12 wherein said locking element is formed from a substantially flat, integral sheet of metal.

21. (Currently Amended) A single use syringe as described in claim 20 ~~including a spring member extending proximally from said base and urging said barbs towards said inside surface of said barrel,~~ wherein each of said first and second legs includes a substantially flat body having inner and outer edges, said first and second barbs extending, respectively, from said outer edges of said first and second legs, said inner edges of said first and second legs being adjacent to said ~~spring member~~third leg.

22. (Original) A single use syringe as described in claim 21 wherein said locking element has a generally trough-shaped configuration.

23. (Currently Amended) A single use syringe as described in claim 21 wherein said ~~spring member includes a third leg extending proximally from said third wall of said base,~~ said third leg ~~including~~ includes a bend therein.
